## **Project Profile**

### **Hazardous Materials Response Training**

Soaring Eagle Safety Consultants has provided HazMat Response training for several industrial facilities. This training is customized based on the industry, hazardous materials present, and the level of team established by the business.

A manufacturer supplying the auto industry established a team of operations level responders to take immediate defensive action and to interact with offsite responders as they arrived. The eight hour training covered all of the elements required by OSHA while building in site specific chemicals. At the end of the training groups were given incidents that could realistically happen at their site and asked to put together an action plan. This helped them apply the information learned and built confidence in their ability to safety respond to an incident.

A pharmaceutical manufacturer requested that technician level refresher training be developed and integrated into a drill that SESC facilitated. Again, the training required by OSHA was integrated into site specific chemicals and operations. The final drill required coordination with outside agencies building on incident management training included in the classroom sessions.

In both situations listed above, students praised the training for being practical, hands on, and applicable to the operations that the responders would likely see.
